Java Array Series – Assignment

Assignment: Count Frequency of an Element in an Array

Write a Java program to find how many times a given target element occurs in an integer array.

■ Problem Statement

The program should take the size of an integer array, accept all array elements from the user, then take a target element and calculate how many times that target element appears in the array.

■ Requirements

1. Take the array size as input.
2. Take all integer elements of the array as input.
3. Take a target element from the user.
4. Traverse the array and count every occurrence of the target element.
5. Display the total frequency of the target element.
6. If the target element is not present, display frequency as 0.

■ Example 1

Input

```
Enter array size: 7
Enter elements: 10 20 10 30 10 40 20
Enter target element: 10
```

Output

```
10 occurs 3 times in the array.
```

■ Example 2

Input

```
Enter array size: 6
Enter elements: 5 8 3 8 2 8
Enter target element: 8
```

Output

```
8 occurs 3 times in the array.
```

■ Example 3 – Element Not Found

Input

```
Enter array size: 5
Enter elements: 10 20 30 40 50
Enter target element: 100
```

Output

```
100 occurs 0 times in the array.
```

■ Restrictions

- Do not use ArrayList, HashMap or any other collection.
- Do not use any built-in frequency/count method.
- Do not create an extra array.
- Use an integer array.
- Use a loop and array indexing.
- Use an if condition to compare each element with the target.

■ Dhuandhar Challenge

Try to calculate the frequency using a single traversal of the array. Think about the logic before writing the code.

■ Hint

Create a counter variable with an initial value of 0. While traversing the array, compare each element with the target. Whenever they are equal, increase the counter.

■ Concepts Practiced

Concept	Practice
Array	Storing and accessing multiple integer values
Loop	Traversing all array elements
Indexing	Accessing elements using array index
if condition	Checking whether an element matches the target
Counter	Counting repeated occurrences

■ Dhuandhar Rule

Question Practice Karo → Logic Build Karo → Code Likho

First solve it yourself. Do not copy the solution. Test your program with multiple inputs, including repeated elements and a target that does not exist.
