Video 2 – Conditionals in C

Assignment Question: ATM Withdrawal Checker

Write a C program that simulates a basic **ATM Withdrawal System**.

The program should take the following inputs from the user:

- **Account Balance**
- **Withdrawal Amount**

Your program must check the withdrawal request using conditional statements.

Requirements

The program should check the following conditions **in proper order**:

1. Minimum Withdrawal Amount

If the withdrawal amount is less than **₹100**, display:

```
Minimum withdrawal amount is Rs.100
```

2. Maximum Withdrawal Limit

If the withdrawal amount is greater than **₹20,000**, display:

```
Maximum withdrawal limit is Rs.20000
```

3. Multiple of ₹100

The withdrawal amount must be a multiple of **₹100**.

If it is not, display:

```
Amount must be a multiple of 100
```

4. Sufficient Balance

If the withdrawal amount is greater than the available account balance, display:

```
Insufficient Balance
```

5. Successful Withdrawal

If all the above conditions are satisfied:

- Deduct the withdrawal amount from the account balance.
- Display a success message.
- Display the remaining balance.

Output:

```
Withdrawal Successful  
Remaining Balance: <remaining balance>
```

Example 1

Input

```
Enter Account Balance: 15000  
Enter Withdrawal Amount: 5000
```

Output

```
Withdrawal Successful  
Remaining Balance: 10000
```

Example 2

Input

```
Enter Account Balance: 15000  
Enter Withdrawal Amount: 550
```

Output

Amount must be a multiple of 100

Example 3

Input

Enter Account Balance: 15000
Enter Withdrawal Amount: 25000

Output

Maximum withdrawal limit is Rs.20000

Example 4

Input

Enter Account Balance: 5000
Enter Withdrawal Amount: 10000

Output

Insufficient Balance

Restrictions

While solving this assignment:

-  Do not use loops
-  Do not use arrays
-  Do not use functions
-  Do not use string conversion
-  Do not copy the solution from the previous question

You may use:

- ✓ if
- ✓ else if
- ✓ else
- ✓ Logical operators
- ✓ Relational operators
- ✓ Modulus operator %

Challenge

Try to make the program so that it gives the **correct reason for failure** instead of simply printing:

```
Invalid Withdrawal
```

Hint

Think carefully about **which condition should be checked first, second, third and fourth**.

First build the logic on paper, then write the C code.

Dhuandhar Rule

Question Practice Karo → Logic Build Karo → Code Likho
